Asus rt-ac66u admin password not working

I have an ASUS RT-N66u router. A few days ago I changed some of the channels to get better TV reception and it's working well. I just tried to log in to check a password on one of the channels and it reports invalid username or password. The username and password is stored in my password manager and I haven't changed anything there. I've tried the default username and password to no avail. I'm stumped. There is nothing particularly urgent right now since everything is working, but this problem does need to get solved before I have a problem. I'll apreciate any suggestions or advice how to proceed. Regards, Tom C 0 When you *need* to get in, or just decide to fix it, reset it (using reset button) to factory defaults (192.168.1.1, admin, admin) and login from a computer connected to an Ethernet cable. You could also just try to login now with what you think your proper setting are using an Ethernet connected computer. 0 When you *need* to get in, or just decide to fix it, reset it (using reset button) to factory defaults (192.168.1.1, admin, admin) and login from a computer connected to an Ethernet cable. You could also just try to login now with what you think your proper setting are using an Ethernet connected computer. 0 I'm on the same computer and I've been trying to log in using my Password Manager. All I know is that I didn't deliberately or knowingly change anything for the router there. I'll do the reset and go from there. Yes, it's connected with an ethernet cable. Thanks for the response. Tom C 0 I haven't had a chance to reset the computer yet; hoping to do that this weekend when I'll reset and will also reset the password from the default. At least for now since I am unable to get in, I'm assuming no one can. I do hope that is rational thinking. Tom C Page 2 Hey guys, Recently i got a MSI GT72-6QD gaming laptop, i have been trying to set it up but every time when i try to use internet, my whole house loses internet. I have tried it several times and i am kinda stuck. Every time i have to reset my router. Help would be greatly appreciated. Model-GT72 6QD-035US Dominator G Operating System-Win 10 Multi-language Processor-Intel Core i7-6700HQ(2.60GHz) Standard Memory-16GB DDR4 Hard Drive-128GB SSD (PCIE GEN3 NVMe) +1TB (SATA) 7200rpm Graphics-nVidia Geforce GTX 970M, 3GB GDDR5 Wireless-Killer N1535 Combo (2*2 ac) 0 It happens due to new laptop. Once you are going to connect any new laptop with internet it starts updating windows.It update about 10-15 GB download so it takes all the internet speed and your other devices stuck.Solution is that leave your laptop online once noone is using internet at home and complete your windows update. 0 It happens due to new laptop. This time keep your wireless security type with AES type.It may resolve your issue otherwise try to change your adapter which make sure its adapter issue. Thanks for your reply. I have tried resetting router couple of times in past. I will try again with AES type security. i doubt it is an adapter problem because i am facing same issue on my mobile phones & laptops. i.e terribly slow speed & video call drop several times within a 2-3 minutes. Page 4 Hello Is it possible to share internet with other computers when I am connected to a wireless hotspot? I can only use internet with a browser (I have to enter username and password in the mozilla). I was able to makrt my hotspot with ppoe connection using virtual router manager at home but with this type of connection when you can only use internet with a browser I do not even know if its possible. 0 Is there anyway I could connect a router to the hotspot so I could share connection with a router and not with a computer? Page 5 hello people i need a big help to find one ipcam wireless that cam need connect direct to wireless from my computer this is for one project to school, im tired to try find someting and i dont have results some one kwon one cam? i see that cam on start TP-Link NC200 IP Camera Wireless - NC200 but that cam using cloud, and i just need cam connect to pc not need router for connect A lot of people use hikvision cameras but there are a lot of IP cameras around. Your largest issue is going to be trying to do this without a router or AP. Your PC is a end device and the camera is a end device they are both designed to be connected to a some device acting as a wireless server....ie a router. You do not need to actually connect the router to the internet. The simplest solution would be to buy a small wireless router and use it as a AP. You would then let the camera connect to the AP and connect your pc to the AP either via wireless or via ethernet. They make very tiny portable hotspots if size is a concern. Now if you are very ambitious you can use your PC as a AP. Most times this is under how do I use my pc as a hotspot discussion. There are many downsides to doing this....mainly you have to be very careful what you use your PC for when this is active because it will degrade the network connection to remote devices. You are in effect making your expensive pc into a $20 router. can u give me some model wireless cam? i need like a network ad hoc i cant use router on middle just pc and ipcam wireless There are way to many models to even think to recommend, you can get anywhere from cheap web cams to 4k devices that will put out 60frames/sec. Cameras generally will not run adhoc. You need some form of "router". Your pc will have to act as the "router". The only difference between adhoc and the pc acting as the router is the software on the PC. The easiest is to buy hotspot software but you it is possible to do this for free but it takes a bit of reading the instructions on microsoft and other sites. A simple free hotspot software will get you lots of options. Page 6 So I accidently disabled wireless on my arris dg1670. (dont ask why im stupid asf) So i put in my ip in my web and it went to the arris page, logged in, disabled wireless and changed nat to bridged. So i can connect to my computer but my wireless is turned off. I then again put in my ip and now i cant even access the arris page because it tells me "This webpage is not available" "ERR_CONNECTION_TIMED_OUT". Please help me im stupid :/ Page 7 So I have purchased a new PCE-AC56 an I have installed it correctly, as Windows detects it. However, after browsing the Internet for few minutes, Internet begins to slow down until it stops working and I have to reboot my router to do it work again. Could somebody help me? I've tried all combinations of drivers (those that come with W10, those that come in the CD, etc) and reinstalled them a lot of times, I have looked for viruses and malware, I also went through the configuration of my router to see all is working properly (and, my other computer, a laptop, works properly, so maybe it's not the router's fault although it works for a few minutes after I restart it). Thanks for your attention My OS is Windows 10 64 Bits 0 at this point, i don't know what else could be the problem. maybe you should just ask the guy who sold it to you? maybe it's a dead card? 0 what speeds are expecting and what are you actually getting? did you try to temporarily connect the pc through ethernet? also, did you get the driver's from asus? 0 what speeds are expecting and what are you actually getting? did you try to temporarily connect the pc through ethernet? also, did you get the driver's from asus? I expect 30 mbps, and I get 0 after a few minutes browsing (Mozilla or Microsoft Edge can't load a web page although Windows shows that I am connected). No, I can't connect the pc through ethernet, and yes, I get the drivers from asus. Thanks! 0 why can't you connect through the ethernet? also, did this issue appear when you upgrade to windows 10? try updating, if that doesn't help, try downgrading back 0 why can't you connect through the ethernet? also, did this issue appear when you upgrade to windows 10? try updating, if that doesn't help, try downgrading back I can't connect through the ethernet because I can't make sure its adapter issue. 0 Your Adapter is connecting with wireless but frequently. It may cause many reason so we can't say hardware issue in the next room). I always had windows 10 in this new computer, I did not update to it. Before, I had an old PCE and I needed to buy a new one, which is the AC56 which does not work. I reinstalled windows, if this helps you. 0 just for troubleshooting purposes, bring to cpu closer to the router. this is merely to rule out problems with the pc itself. also, maybe you need to try to downgrade, as i've seen a few issues myself when i moved to windows 10. I can't bring my computer closer to the router, I'm sorry, but my signal strengh is the best. I can not downgrade, my I bought W10 with my computer. And, I've bring to cpu closer to the router. this is merely to rule out problems with the pc itself. also, maybe you need to try to downgrade, as i've seen a few issues myself when i moved to windows 10. I can't bring my computer closer to the router, I'm sorry, but my signal strengh is the best. I can not downgrade, my I bought W10 with my computer. And, I've read comments of other users that have w10 in the web where I bought it, and it works perfectly for them. 0 maybe someone else is using up the bandwidth? try to see in task manager is something else in your pc is using the internet, because i have personally seen windows 10 updates suck up all the internet. 0 maybe someone else is using up the bandwidth? try to see in task manager is something else in your pc is using the internet, because i have personally seen windows 10 updates suck up all the internet. No, and the matter is not that my Internet is slow or something, the issue is that i am unable to browse the Internet after few minutes. Then, I reboot my router, and I am able to surf again for a few minutes until it stops. 0 is it showing up in device manger? 0 is it showing up in device manger? Yes, everything is normal. The only issue is that after few minutes of browsing, sometimes seconds, I am unable to continue browsing although windows says I'm connected. 0 i am confused, is your problem solved? also, i just came across this, maybe it has something to do with your motherboard drivers? 0 i am confused, is your problem solved? also, i just came across this, maybe it has something to do with your motherboard drivers? No, but I solved it without purpose, and I don't know how to mark it again as unsolved. I just updated all of my computers drivers and all are updated and working fine. 0 at this point, i don't know what else could be the problem. maybe you should just ask the guy who sold it to you? maybe it's a dead card? 0 at this point, i don't know what else could be the problem. maybe you should just ask the guy who sold it to you? maybe it's a dead card? Thank you for your help, really. Tomorrow I am going to buy a new one, the TP-Link Archer T8e, I hope this NIC works this time. Thanks!! Page 8 Hello, I currently live with 4 other roommates. A new roommate recently moved into the apartment, and we have noticed our internet is extremely slow (or disconnects) when the roommate is home. This past week the roommate is away on vacation, and there have been no problems with internet. This particular roommate downloads many movies, etc. In addition, the roommate works within computer programming, and utilizes many devices. Is there way to limit the amount of use/access to the roommate's devices? All suggestions are appreciated! I forgot to mention we use Verizon fios for internet. Thank you 0 Roomie may be causing the problem inadvertently or at least thoughtlessly by seeding torrents. Seeding will jam the upload connection and slow everything down. Offer to look at his computer with him to see if you can identify the cause and look for a torrent client, like utorrent. Then politely help him to stop or significantly throttle the uplinking. If he doesn't go along with the friendly intervention and the rest of the room feels the need to be more aggressive, there may be a way to block the ports. 0 Probably not, since I doubt that Verizon is providing a router with QOS or rationing controls. But what router do you have? There's always the social solution - talk to the roomate, or split the bill by usage. 0 Probably not, since I doubt that Verizon is providing a router with QOS or rationing controls. But what router do you have? There's always the social solution - talk to the roomate, or split the bill by usage. Or get a separate, slower WAP just for that one person. The router we have is Actiontec MI424WR Verizon Fios Dual Band Gigabit Wireless Router 4 Port Gigabit. The utilities are within the landlord's name. The household is a "rent a room" situation. We have tried talking to the roommate, but denies having multiple devices. I can tell when the roommate is home, because all of sudden the internet will be extremely slow. Thank you for your input! Hopefully then description of the router helps! 0 Hmm, I've got one of those, so I'll poke around when I get home and see if there's a way to throttle a particular user. Have you asked Verizon support? 0 Hmm, I've got one of those, so I'll poke around when I get home and see if there's a way to throttle a particular user. Have you asked Verizon support? Thanks! I have not asked Verizon support. That will be my next step. I was hoping there was a program that gauged the person's usage. I wanted to be absolutely sure it was that roommate. Question: I was wondering if the roommate had some type of program that enabled them to gain a stronger signal? Thank you for the suggestions! Sorry for some many questions. 0 No, the roomie isn't running some sort of accelerator to grab your bandwidth. Just hogging it. 0 Roomie may be causing the problem inadvertently or at least thoughtlessly by seeding torrents. Seeding will jam the upload connection and slow everything down. Offer to look at his computer with him to see if you can identify the cause and look for a torrent client, like utorrent. Then politely help him to stop or significantly throttle the uplinking. If he doesn't go along with the friendly intervention and the rest of the room feels the need to be more aggressive, there may be a way to block the ports. Failing that, it is possible to set him up on a separate wifi access point and set it to run in B mode to limit his bandwidth. Page 9 So as far as I know I use a DSL connection through phone jacks in the wall. I have a large house and the internet phone jack is in the very corner, missing much of the house. I however have a phone jack that has cable. Can I use that phone jack for internet instead of cable? 0 Have you tried raising the DSL router up higher in the existing location.... Regarding the use of the other phone jack - possibly yes. Depends on the overall house telephone wiring and the condition of the desired phone jack. First plug in a telephone to see if the phone jack works. If not look inside the jack to see if all of the wires are connected and secure. If so, then you can unplug the DSL connection from the current jack and move it all to the desired jack. Remember that the DSL line has a splitter serving a telephone and the router. There may be installation instructions and diagrams that came with your DSL cable modem. Follow all of the wiring as best you can to see where it leads and what is connected. Sketch out and lable all the existing hookups. Take a photographs even. Move the router and see if it works. If not, move it back. Do not change or move anything else. You may also need to reset the router so be sure to write down the current settings. Make sure you have admin rights. If doing any of the above is uncomfortable for you then try to find someone knowledgeable to help. Failing that you should probably contact your ISP. 0 Have you tried raising the DSL router up higher in the existing location.... Regarding the use of the other phone jack - possibly yes. Depends on the overall house telephone wiring and the condition of the desired phone jack. First plug in a telephone to see if the phone jack works. If not look inside the jack to see if all of the wires are connected and secure. If so, then you can unplug the DSL connection from the current jack and move it all to the desired jack. Remember that the DSL line has a splitter serving a telephone and the router. Do not change or move anything else. Page 10 So I'll try to make this as clear as possible. I recently got a new modem/router from Telstra (Telstra Gateway Max ADSL), and it's suppose to provide 65Mbps (2.4gh), 300Mbps (5gh). However, when I'm downloading torrents (Vuze) I'm only getting 350+kBps (on 2.4gh and 5gh). With my old modem/router (which was a Thomson model back in 2007) which was provided by Telstra I was getting the same amount of kBps, but only 30Mbps. Could someone please explain why I'm only getting such a low amount? 0 0 One, it all depends on the torrent and number of people. Two, wifi can vary by a ton of factors including other wifi's on the same channel as yours. What does a speed test say. Torrents are not a way to determine speed. 0 @getochkn, the seeds and leeches don't matter as much as it used to. Like no matter what I download I will always get 350+kBps, this is when no one is the Internet, and what are some other ways to determine my internet speed? 0 Page 11 0 Hi Some ISPs throttle torrent downloads. 0 As you download you also seed the completed segments of the file. Unlimited speed seeding will eventually choke a connection. Set an uplink limit in uTorrent.
